

15,000 Veterans will experience a **stroke** every year.
80% will have long-lasting weakness in their
hand and arm.

If **you** have had a **stroke**, you may be eligible for a research study.

You may be eligible if you:

- Had a stroke more than 6 months ago
- Have hand or arm weakness after a stroke
- Are able to get an MRI
- Do not have a history of seizures

Participants can expect to:

- Complete 8-9 hours of testing over 2-3 visits at the Providence VA Medical Center
- Answer questions about your stroke and rehabilitation history
- Undergo various tests of arm and hand function
- Receive an MRI and Transcranial Magnetic Stimulation (TMS)

Volunteer for a research study to help learn more about how Veterans have recovered **hand and arm function** after **stroke**. Knowledge gained from this study will be used to one day help develop better **rehabilitation** treatments for stroke survivors.

Participation in research is voluntary. Compensation will be provided after research visit completion. Transportation to and from your visits may be available.
